

IN THE CLAIMS:

Cancel Claims 15 and 22.

Amend Claims 20 and 21 as follows:

1.-4. (canceled)

5. (previously presented) A bad-sector search method, comprising:

a bad sector recording step whereby when receiving a command that accesses a sector on a disk-shaped recording medium placed in a data recording device, a bad sector is detected, and then an address of the bad sector is recorded in a memory;

a determining step for determining whether or not the data recording device is executing a command;

a detecting step whereby if it is determined that the data recording device is not executing a command, addresses of surrounding sectors adjacent to the bad sector, the address of which is recorded in the memory, are recorded in the memory, and then whether or not each of the surrounding sectors is a bad sector is detected; and

a bad-surrounding-sector recording step whereby if the surrounding sector is not a bad sector, the address of the surrounding sector is deleted from the memory, and if the surrounding sector is a bad sector, the address of the surrounding sector is recorded in the memory as a bad sector;

if the number of steps of error recovery procedures executed for data recorded in the surrounding sector exceeds a predetermined specified value, the detecting step detects that the surrounding sector is a bad sector; and wherein said detecting step further comprises:

processing that deletes an address of a sector, a search for which has already been completed, from the addresses of the surrounding sectors in the memory; and

processing whereby focusing on the two bad sectors adjacent to each other, each address of surrounding sectors adjacent to one bad sector is mutually compared with each address of surrounding sectors adjacent to the other bad sector, and one of duplicated surrounding sectors is deleted from the memory.

6.-8. (canceled)

9. (original) A bad-sector search method according to Claim 5, wherein:

an interruption step for immediately interrupting the detecting step when the data recording device receives a command.

10. (original) A bad-sector search method according to Claim 5, further comprising:

a step for recording history information about an interrupted search for a bad sector in the memory,

wherein the detecting step is executed according to the history information recorded in the memory.

11.-19. (canceled)

20. (currently amended) A method of searching for a bad sector among surrounding sectors in a data storage device, comprising:

(a) initiating a search for a bad sector having an earliest recorded search history information of unsuccessful location of the bad sector among one or more bad sectors;

- (b) determining whether information is recorded as search history information about the bad sector to be searched for;
- (c) if no information is recorded as the search history information about the bad sector, initializing data about the search for the bad sector;
- (d) recording "search being executed" as the search history information corresponding to the bad sector to be searched for;
- (e) executing processing of the search for the bad sector;
- (f) recording "search completed" when the search is completed, and continuing with step (k);
- (g) recording "search completed[[;]]";
- (h) checking whether there is a bad sector that should be searched for;
- (i) if there is a bad sector to be searched for, selecting the bad sector, and recording "search being executed" before proceeding to step (e);
- (j) if there is no bad sector to be searched for, ending the search;
- (k) receiving a command [[comes]] from a host computer while executing the search;
- (l) recording "search interrupted/restart waited" as the search history information corresponding to the bad sector that is being searched for; [[and]]
- (m) interrupting the search[[.]]; and further comprising:
 - recording information about sectors surrounding the bad sector as data about the search for the bad sector after the surrounding sectors have been searched; and
 - interrupting the search at any point when a command from the host so that the search may be performed without hindering the command from the host.

21. (currently amended) ~~A method according to Claim 20, wherein step (a) comprises A method of searching for a bad sector among surrounding sectors in a data storage device, comprising:~~

- (a) initiating a search for a bad sector having an earliest recorded search history information of unsuccessful location of the bad sector among one or more bad sectors and locating a bad sector profiled as "search interrupted/restart waited" or "search not started";
[[and]]
- (b) determining whether information is recorded as search history information about the bad sector to be searched for;
- (c) if no information is recorded as the search history information about the bad sector, initializing data about the search for the bad sector;
- (d) recording "search being executed" as the search history information corresponding to the bad sector to be searched for;
- (e) executing processing of the search for the bad sector;
- (f) recording "search completed" when the search is completed, and continuing with step (k);
- (g) recording "search completed";
- (h) checking whether there is a bad sector that should be searched for;
- (i) if there is a bad sector to be searched for, selecting the bad sector, and recording "search being executed" before proceeding to step (e);
- (j) if there is no bad sector to be searched for, ending the search;
- (k) receiving a command from a host computer while executing the search;

(l) recording "search interrupted/restart waited" as the search history information corresponding to the bad sector that is being searched for;

(m) interrupting the search; and

storing information about bad sectors in a ring buffer and, if there is no more free area in the ring buffer where the information is recorded, recorded information is deleted in the order the information was recorded, and then new information is overwritten at a location where the recorded information is deleted.

22. (canceled)
